RESEARCH PROGRESS REPORT FOR 1991

"Physiological and Cultural Studies on Potatoes"

Submitted by

David G. Holm

San Luis Valley Research Center

Research was conducted in the following areas in 1991:

- A) Postharvest Evaluations
  - 1 - Blackspot Susceptibility
  - 2 - Storage Weight Loss and Dormancy
  - 3 - Enzymatic Browning
  - 4 - Specific Gravity, Chip Color, French Fry Color and Texture
- B) Raw Product Processing Quality Survey
- C) Influence of Row Size and Nitrogen Fertility on Yield, Grade, and Internal Pink Discoloration of Russet Nugget Tubers
- E) Influence of Cut vs. Single Drop Seed on Yield and Grade of Five Cultivars

POSTHARVEST EVALUATIONS

A total of 131 clones (including duplicates and checks) were evaluated for two or more of the following characteristics: blackspot susceptibility, storage weight loss, dormancy, enzymatic browning, specific gravity, chip color, french fry color, and french fry texture. Data collected for specific gravity and chip color for chipping selections is presented in the "Potato Breeding and Selection Report". Twenty-one clones were selected for additional quality evaluations by Dr. Joe Maga. Results of these evaluations are found in his report.

Blackspot

Ten randomly selected tubers for each clone tested were bruised on the stem and bud ends with a 150 g weight dropped from a height of 60 cm. Tubers were stored at 40F prior to bruising. After bruising, tubers were stored at room temperature for three days prior to evaluation. Blackspot susceptibility was evaluated by cutting the tubers in half longitudinally and rating the extent of damage.

High levels of blackspot resistance (indices >4.0) were exhibited by 55% of the samples tested (Figure 1). Blackspot ratings (average of bud-and stem-end readings) ranged from 1.4-5.0, with an average of 3.9 (Table 1). Selections which should be observed carefully for potential blackspot

problems are A80559-2, AC83311-2, AC83311-5, AC84610-5, A082283-1, C084111-6, C086142-3, C086224-1, ND651-9, ND2008-2, ND2109-7, and Snowden.

#### Storage Weight Loss and Dormancy

Ten randomly selected tubers were weighed into storage on October 22, 1991 and held at 45F for a three month period under low relative humidity conditions to evaluate storage weight loss potential. These tubers were also observed weekly for sprout growth. Dormancy was reported as days after harvest to first visible growth. Results are summarized in Figures 2 and 3 and Table 1.

The average storage weight loss was 3.1% for the three month period. Weight loss ranged from 1.7-5.1%.

Length of dormancy ranged from 74-151 days. Most selections evaluated had shorter dormancy periods than Russet Burbank. A few selections approached the dormancy of Russet Burbank. They are: AC83044-1, AC83306-1, and C086153-2. These selections will be useful in breeding for longer dormancy.

Continuing emphasis will be placed on breeding for longer dormancy, which will be needed if the use of sprout inhibiting chemicals were to be restricted.

#### Enzymatic Browning

Five tubers of each clone were cut in half lengthwise and rated for degree of darkening at 30 and 60 minutes after cutting. Results are shown in Figure 4 and Table 1.

Little or no browning was observed for 38% of the samples even 60 minutes after tuber cutting. Enzymatic browning potential at 60 minutes ranged from 2.0-5.0, with an average of 3.4. Atlantic is very resistant to enzymatic browning. Red LaSoda is very susceptible.

Continuing emphasis will also be placed on breeding for reduced enzymatic browning potential because of the concern over the use of sulfites in processed food products.

#### Specific Gravity

Data on specific gravity are summarized in Figure 5 and Table 2.

Specific gravities ranged from 1.066-1.121; 68% were >1.080. The average specific gravity was 1.086. The lowest specific gravity generally considered ideal for processing is 1.080.

### Fry Color and Texture

Data are presented in Figures 6 and 7, and Table 2 on french fry color and texture.

Thirty-four samples (47%) produced french fries with acceptable color and texture.

### RAW PRODUCT PROCESSING QUALITY SURVEY

Thirty-two lots of potatoes representing six cultivars (Centennial Russet, Frontier Russet, Russet Burbank, Russet Norkotah, and Russet Nugget) were evaluated for raw product processing quality for the Processing Committee. Specific gravity ranged from 1.072 for Russet Norkotah to 1.088 for Russet Nugget (Figure 8). Additional data on sugar content at various storage intervals was collected and will be reported by Joe Maga.

### INFLUENCE OF ROW SIZE AND NITROGEN RATE ON RUSSET NUGGET YIELD, GRADE, AND INTERNAL PINK DISCOLORATION

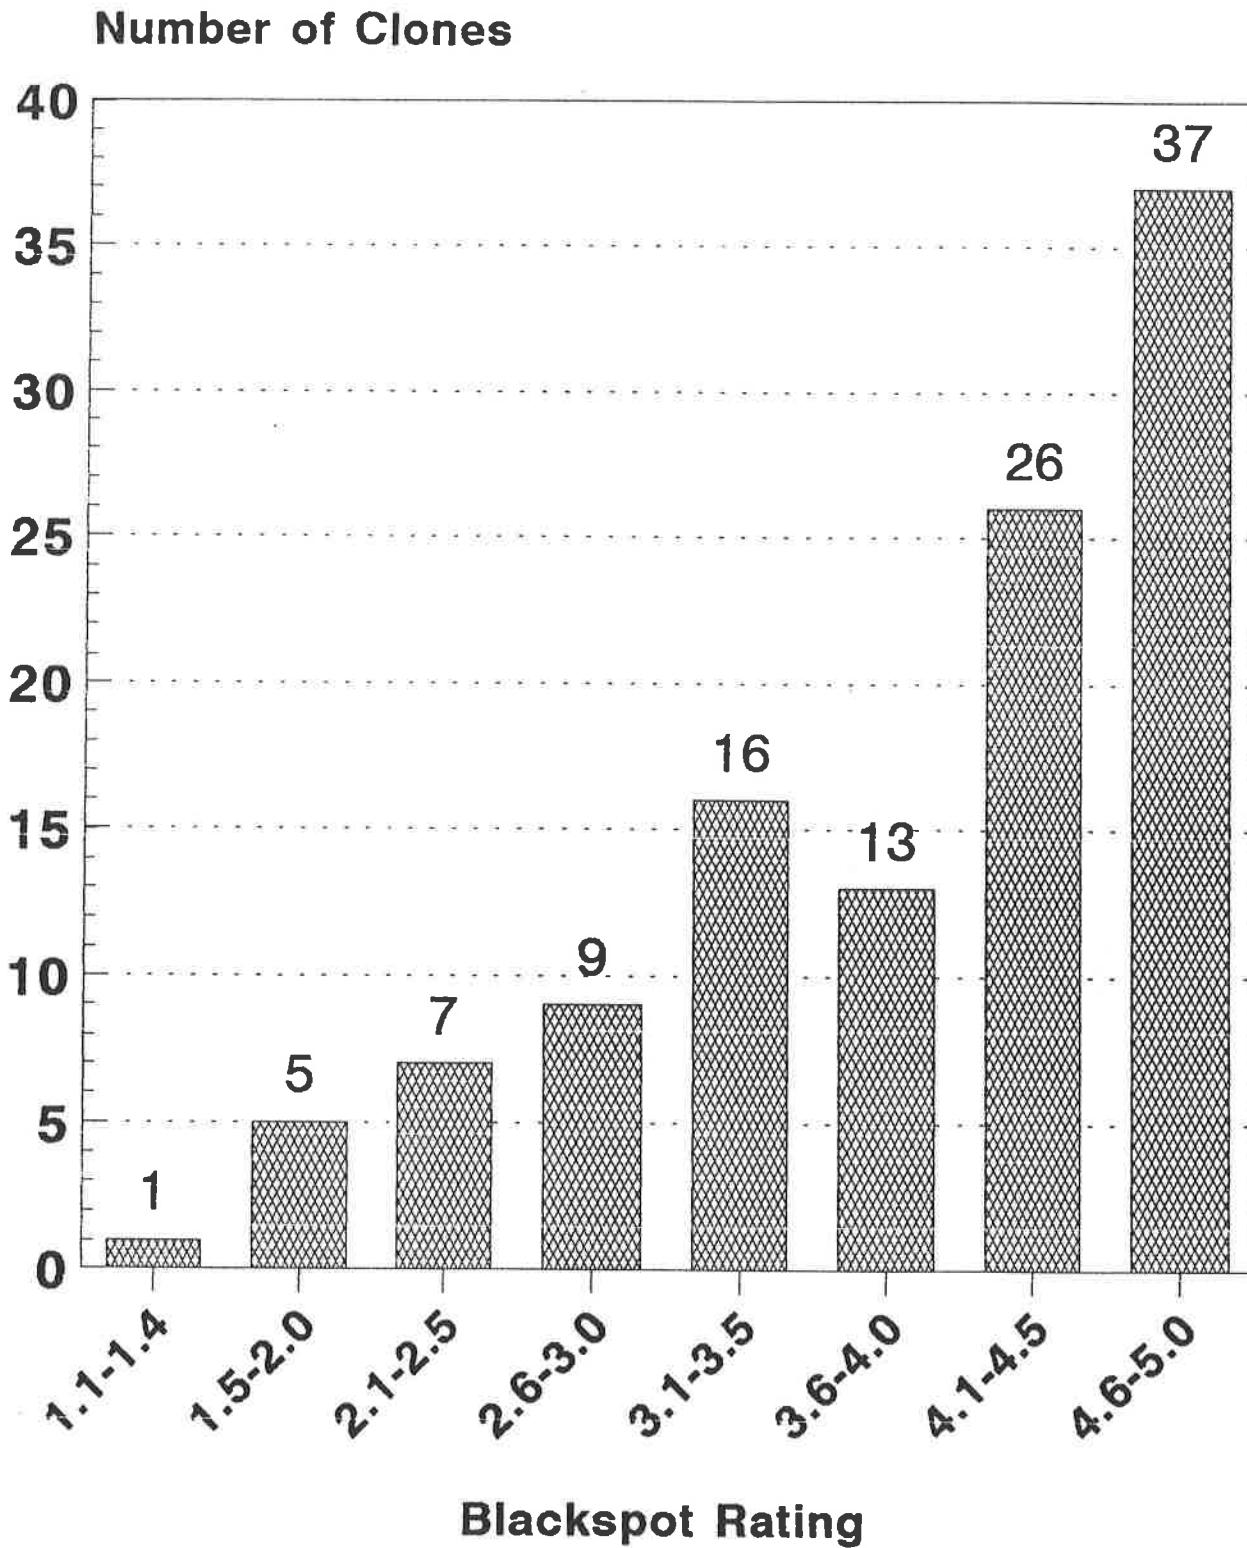

The influence of row size and nitrogen fertility on yield, grade, stand, and internal pink discoloration of tubers of Russet Nugget was evaluated. Nitrogen rate had no significant effect on any of the variables measured. Small row size resulted in significantly lower total, US #1, and >10 oz tuber yields. Small row size also resulted in slightly less internal pink discoloration.

### INFLUENCE OF CUT VS. SINGLE DROP SEED ON YIELD AND GRADE

The influence of single-drop and cut seed on yield, grade, stand and stem number of Centennial Russet, Russet Burbank, Russet Norkotah, Russet Nugget, and Sangre was studied. Planting single-drop seed resulted in greater total yields, greater yields of <4 oz tubers, slightly lower stands, and more stems per plant.

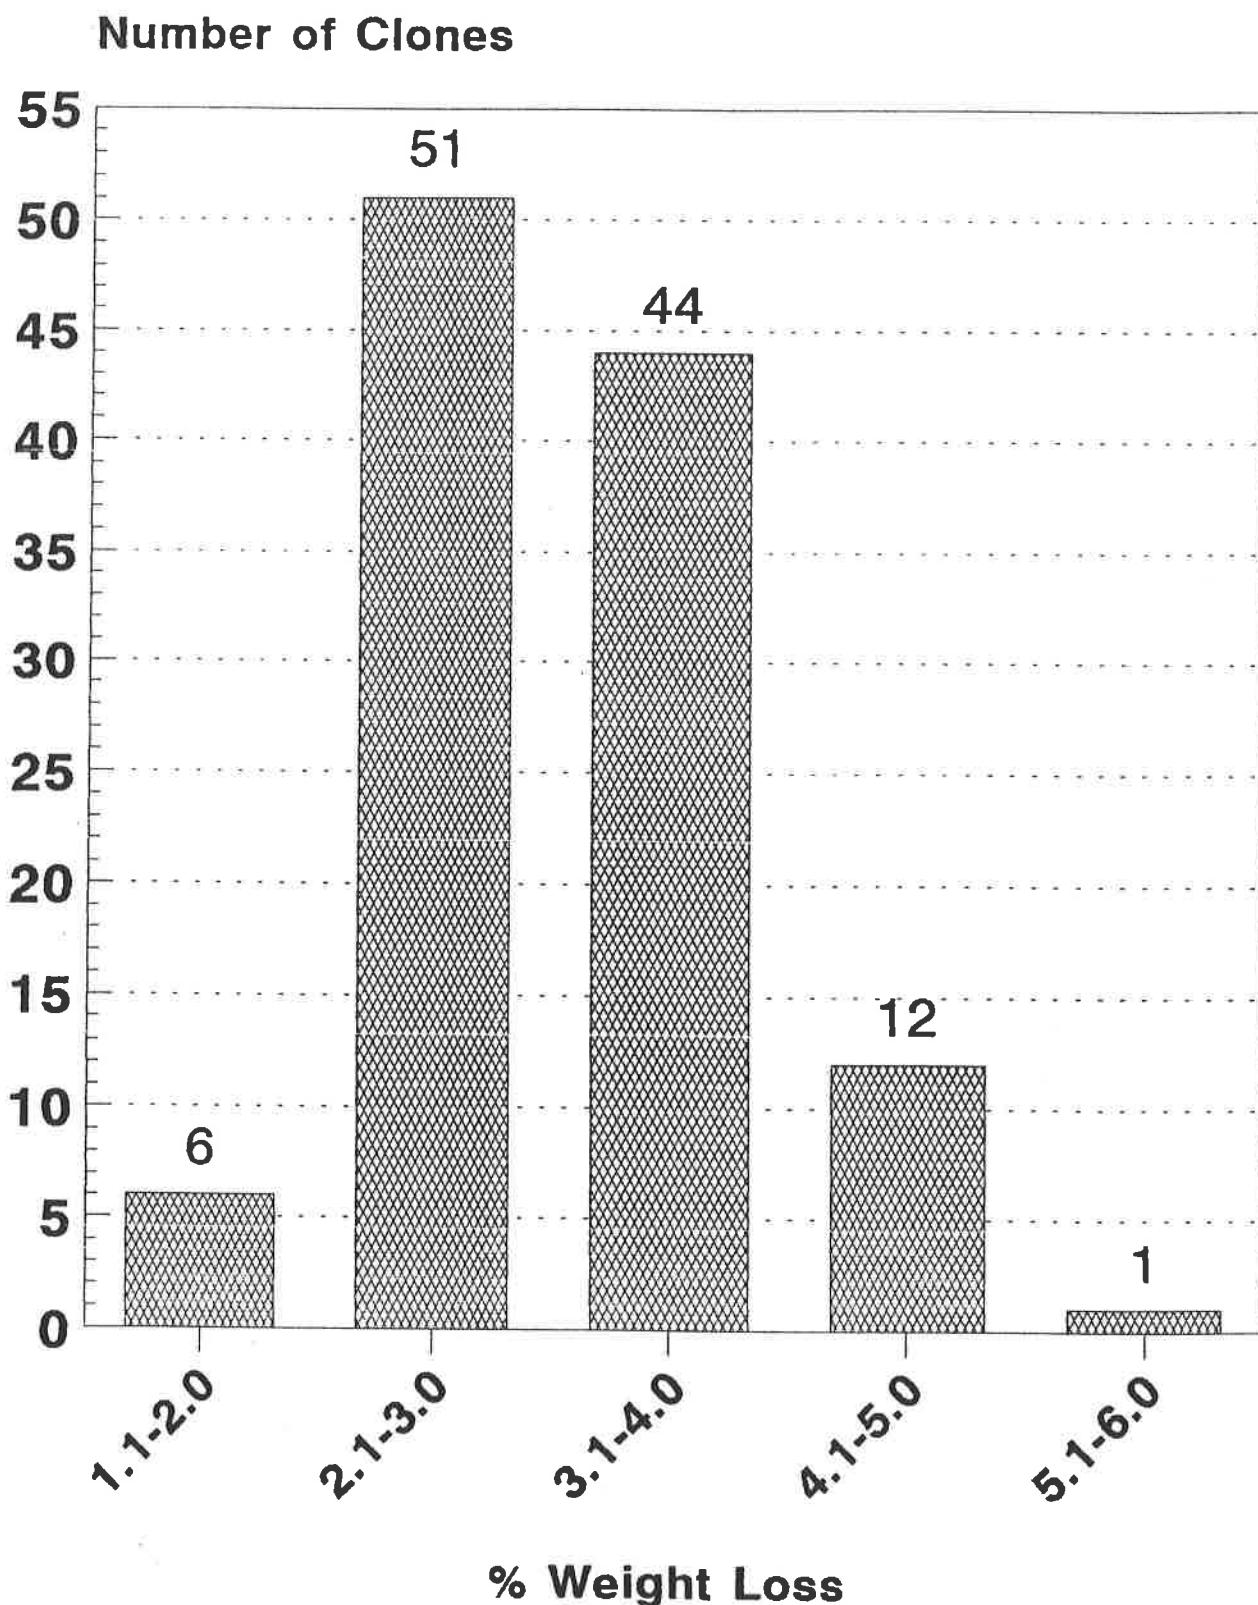

Significant differences were observed between cultivars for all characteristics measured except % stand.

Continued

Table 2. Continued.

Clone	Specific Gravity	Fry Color <sup>1</sup>			Fry Texture <sup>2</sup>		
		At Harvest	4 wks 8 wks	50F+ 45F	At Harvest	4 wks 8 wks	50F+ 45F
<b>** Western Regional Trial (continued) **</b>							
Russet Burbank	1.088	4		3		3	3
Russet Norkotah	1.073		3		2		4
Sangre	1.075		2		1		2
Shepody	1.089		3		2		4

<sup>1</sup>Fry color was rated on a 1 to 5 scale, with 5 being the lightest or best color. Color ratings of  $\geq 3$  are acceptable.

<sup>2</sup>Fry texture was rated on a 1 to 5 scale, with 5 indicating the cooked flesh was dry, with 1 representing a soggy, wet texture.

Significance <sup>2</sup>	NS	NS	NS	NS	NS	NS	NS

<sup>1</sup>Vine maturity is rated on the following basis: 1=very early; 2=early; 3=medium; 4=late; and 5=very late.

<sup>2</sup>The color index integrates the number of tubers observed with pink discoloration and the severity of the discoloration.

<sup>3</sup>LSD=least significant difference. NS=not significant; +P=0.10; \*P=0.05.

Table 4. Influence of seed type on yield, grade, stand, vine maturity, average tuber weight, stems per plant, and tubers per stem of four cultivars - 1991.
